Squence 116, Application US/09905083

Patent No. US20020146708A1

Patent No. US20020146708A1

APPLICANT: O'Brien, Timothy J.

TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of TITLE OF INVENTION: O'Arian Cancer

TITLE OF INVENTION: O'Arian Cancer

FILE REFERENCE: D62230TF/C/Dia/

CURRENT APPLICATION NUMBER: US/09/905,083

CURRENT FILING DATE: 2001-07-13

PRIOR FILING DATE: 2000-02-11

NUMBER OF SEQ ID NOS: 136

LENGTH: 9

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 2

Suppressor protein SSL1 - yeast (Saccharomyces cerevisiae)
Suppressor protein SSL1 - yeast (Saccharomyces cerevisiae)
Suppressor protein L1531; protein YLR005w
C; Species: Saccharomyces cerevisiae
C; Species: SAG394; SSG4827
S; Yoon, H.; Miller, S.P.; Pabich, E.K.; Donahue, T.F.
Genes Dev. 6, 2463-2477, 1992
A; Title: SSL1, a suppressor of a HIS4 5'-UTR stem-loop mutation, is essential for transling A; Reference number: A46394; MuID:94040711; PMID:1340463

A,Cross-references: GB:Z17385; NID:g2695; PID:g2696 R;Vandenbol, M.; Portetelle, D.; Hilger, F. submitted to the Protein Sequence Database, May 1996 A;Reference number: S64742

C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 28-Unl-2000 #sequence_revision 28-Unl-2000 #text_change 28-Jul-2000
C;Accession: T51136
R;Davenport, R.J.; Kiegle, E.A.; Tester, M.
submitted to the EMBL Data Library, December 1999
A;Pescription: Glr5, an ionotropic glutamate receptor ortholog from Arabidopsis.
A;Reference number: Z25309
A;Accession: T51136
A;Status: preliminary; translated from GB/EMBL/DDBJ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Residues: 1-506 <STO>

B97856
hypothetical protein RC1250 [imported] - Rickettsia conorii (strain Malish 7)
C;Species: Rickettsia conorii
C;Date: 30-Sep-2001
C;Accession: B97856

      cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-
|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.
--- TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and Ridney.
---- SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

-!- CATALYTIC ACTIVITY: Broad endopeptidase specificity. Cleaves Glu-
-!- CATALYTIC ACTIVITY: Proad endopeptidase specificity. Cleaves Glu-
Val-Asn-Leu-|-Asp-Ala-Glu-Phe in the Swedish variant of Alzheimer's amyloid precursor protein.
-!- SUBCELULIAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to peptidase family Al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MIM; 605668; -

Nature 387:394-401(1997).
-!- CATALYTIC ACTIVITY: UDP-glucose + D-glucose 6-phosphate = UDP +
alpha, alpha-trahalose 6-phosphate.
-!- SIMILARITY: Belongs to the glycosyltransferase family 20.
-!- SIMILARITY: STRONG, TO A NON-FUNCTIONAL COPY IN NGR234, FQ1-FQ2,
TRUNCATED BY A ISRM3-LIKE INSERTION ELEMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE-97305956; PubMed-9163424;

"MIL-MMP-deficient mice develop dwarfism, osteopenia, arthritis, and
connective tissue disease due to inadequate collagen turnover.";

[1] 99:81-92 (1999).

[2] 19:81-92 (1999).

[3] FUNCTION: Endopeptidase that degrades various components of the
extracellular matrix, such as collagen. Activates progelatinase A.
Essential for pericellular collagencylsis and modeling of skeletal
and extraskeletal connective tissues during development.

[3] PORALTIC ACTIVITY: Endopeptidase activity Activates
and extraskeletal connective tissues during development.

[4] PORALTIC ACTIVITY: Endopeptidase activity Activates

"Expression and localization of membrane type 1 matrix

metalloproteinase in tooth tissues.";

metalloproteinase in tooth tissues.";

Matrix Biol. 17:501-511(1998).

L. FUNCTION: Seems to specifically activate progelatinase A. May thus trigger invasion by tumor cells by activating progelatinase A on the tropophida activity. May play a role in the biomineralization of enamel and dentin.

L. CATALYTIC ACTIVITY: Endopeptidase activity. Activates progelatinase A by cleavage of the propeptide at 37-Asn-|-Leu-38.

C. -- CATALYTIC ACTIVITY: Endopeptidase activity. Activates of cher bonds hydrolyzed include 35-Gly-|-Ile-36 in the propeptide of collagenase 3, and 341-Asn-|-Phe-342, 441-Asp-|-Leu-442 and 35-Gly-|-Ill-355 in the aggreen integralobular domain.

C. -- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

C. -- SIMILARITY: Belongs to peptidase family MIOA.

C. -- SIMILARITY: Contains 1 hemopexin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. Note-No experimental confirmation available;
SIMILARITY: Belongs to the sorting nexin family.
SIMILARITY: Contains 1 RGS domain.
SIMILARITY: Contains 1 phox homology (PX) domain.
SIMILARITY: Contains 1 PAA domain.
CAUTION: Ref. 1 sequence differs from that shown due to a frameshift in position 887.
"RGS-PX1, a GAP for Galphas and a sorting nexin in vesicular trafficking."; Submitted (SRP-2001) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Event=Alternative splicing; Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IsoId=Q9Y5W8-1; Sequence=Displayed;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 99, Application US/09502600A

Patent No. 6294344

GENERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
TITLE OF INVENTION: Compositions and Methods for the Early Diagnosis of TITLE OF INVENTION: O'Azrian Cancer
FILLE REFERENCE: D6223CIP-C
CURRENT FILLING DATE: 2000-02-11
CURRENT PAPLICATION NUMBER: US/09/502,600A
PRIOR APPLICATION NUMBER: US/09/39,211
PRIOR FILLING DATE: 03-14-1996
NUMBER OF SEQ ID NOS: 136
SEQ ID NO 99
LENGTH: 9
MAPPL DEPTICATION OF 99
LENGTH: 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

Sequence 7, Application US/09261416A

Parent No. 6291663

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Underwood, Lowell J.
TITLE OF INVENTION: TADG-12: A No. 6291663el Transmembrane Serine Protease
TITLE OF INVENTION: TADG-12: A No. 6291663el Transmembrane Serine Protease
TITLE OF INVENTION: Overexpressed in Ovarian Carcinoma
FILE REFERENCE: D6192
CURRENT FILING DATE: 1999-03-03
NUMBER OF SEQ ID NOS: 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FEATURE:
CHER INFORMATION: Serine protease catalytic domain of stratum corneum
OTHER INFORMATION: chymotryptic enzyme (Scce) homologous to similar
OTHER INFORMATION: domain in TADG-12
US-09-261-416-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ) OTHER INFORMATION: Amino acid sequence of stratum corneum chymotryptic ; OTHER INFORMATION: enzyme (scce) catalytic domain US-09-618-259-4
                                                                                                                                                                                                                          APPLICANT: O'Brien, Timothy J.

Sequence 2, Application US/09154344

Sequence 2, Application US/09154344

Patent No. 598126

GENERAL INFORMATION:
APPLICANT: BGalrud, Torbjorn
APPLICANT: Hansson, Lennart

TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic

TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic

TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic

TITLE OF INVENTION: Brayme (SCCE)

CORRESPONDENCE ADDRESS:
ADDRESSEE: Maite & Case, Patent Department

STREET: New York

human SCCE peptide

100.0%; Score 42; DB 4; Length 9;

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCB oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically

binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aborrant physiological interactions of the polypeptide described of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the above polypeptide; no modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mamunomodulator; cytostatic, nocropic, antibacterial, virucide, immunomodulator; cytostatic, nocropic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful In manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid sorders such as diabetes or obesity, infections, cachexia, cancer, advances in chromosome mapphing, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the present invention. \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 1; Page 171; 586pp; English.

The present invention describes NoVX proteins, where X can be 1 to 55 (e.g. NoV1). Also described: (1) a composition comprising a polypeptide described above; (3) an isolated nucleic acid described above; (3) an isolated nucleic acid containers, the composition described above; (3) an isolated nucleic acid molecule described above; (5) a call comprising the nucleic acid molecule described above; (5) a call comprising the bucketor; (6) an attibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a comprising a pathology that is falted to an aberrant expression or aberrant physiological interactions of the polypeptide described above; (10) a method for identifying a potential therapeutic agent for aberrant physiological interactions of the polypeptide; (11) a method of activity of the polypeptide described above; (13) methods of treating or pathology associated with the polypeptide; (11) a method or protein a pathology associated with the above polypeptide in a corporation; and (14) a method for notworing the above polypeptide in a mammalian and (14) a method for notworing the above polypeptide in a mammalian and (14) a method for notworing the above polypeptide in a mammalian and call in manufacturing a method or protein and antilipaemic activity of the polypeptide described above; (13) methods of treating a mammalian and call and a method or solve polypeptide or solve polypeptide and antilipaemic associated with a nucleic and antilipaemic accided with a human disease. The polypeptide or the nucleic and antilipaemic associated with a server or protein associate disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, nematopoletic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and Dipippo VA;

Malyankar UM;

obesity,

```
The present invention describes NOVX proteins, where X can be 1 to 55 cd ear. NOV1). Also described alove; (3) a kit composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated nucleic acid containers, the composition described above; (3) an isolated nucleic acid contributed above; (5) a cell a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically comprising the above polypeptide fearcribed above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for abort; (11) a method of a pathology that the polypeptide; (12) a method of containing the activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide. NoVX sequences have antidabeted; anorectic, antipacerial, virtualed. Or preventing a pathology associated with the above polypeptide or the nucleic summannendulator, cytostatic, norropic, neuroprotective, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. The collaborate such as diabetes or obesity, infections, cancer, calid molecule may be used to diagnose, treat or prevent metabolic acid disorders such as diabetes or obesity, infections, cancer, context or preventive disorders such as allowed or prepresents and various contextive disorders because or between the properties of polypeptide 
                                                                                                                                                                                                                               New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a

sample; (w) metricous iou uscretaining une presence of the pablyperiodic to a disease associated with altered levels of expression of the above collaborate or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or preventing a pathology associated with the above polypeptide in a method for producing the above polypeptide in a method for producing the above polypeptide; NoVX condumnal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide in a method for producing the above polypeptide of the nucleic and antilipaemic activities, and can be used in gene therapy. The copyreptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic consucrates such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoletic disorders and various and various probably interaction and probably insure typing, preventive medicine and probably the present sequence represents a human NOVX from the propagate inverse. methods for determining the presence of or predisposition to sample; (8 a disease

Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of cpds. useful for treating or develop products for the design associated with beta-amyloid peptide, esp. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Human SCCE protein N-terminal fragment SEQ ID 48.

SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serine protease; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; dermal inflammation; pruritus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

```
This invention describes a novel non-human transgenic mammal or mammalian compro having integrated within its genome, a heterologous nucleotide emprop having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a gratum conneum chymotryptic enzyme (SCCE) or its variant, or serial in skin. The product of the invention is useful as a model or its variant in skin. The product of the invention is useful as a model or ameliorate a pathogenic condition, for development, to relieve or ameliorate a pathogenic condition, for development or testing of a commercial to a pharmaceutical formulation, and for the development of a diagnostic method. It can also be useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an experience of inflammatory skin diseases elected from diseases consisting of epidermal inflammatory skin diseases elected from diseases consisting of pruritus, atopic dermatitis, eczem, acme and inherited skin diseases with hepidermal hyperkeratosis, contines of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal fragment of the human kallikrein 7 (KLK7), used in the development of the synonymous with human kallikrein 7 (KLK7), used in the development of the invention
                                                                                                                                                                                                                                                                                                                                                                                             Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

BET1 protein - yeast (Saccharomyces cerevisiae)
NAlternate names: protein VIA4c; protein VIL004c; SLV12 protein
C;Species: Saccharomyces cerevisiae
C;Date: 13.Sep-1991 #sequence_revision 13.Sep-1991 #text_change 29-Oct-1999
C;Accession: C39610; 848453; 538677
